June 7th 2017

Allogeneic hematopoietic cell transplantation (HCT)

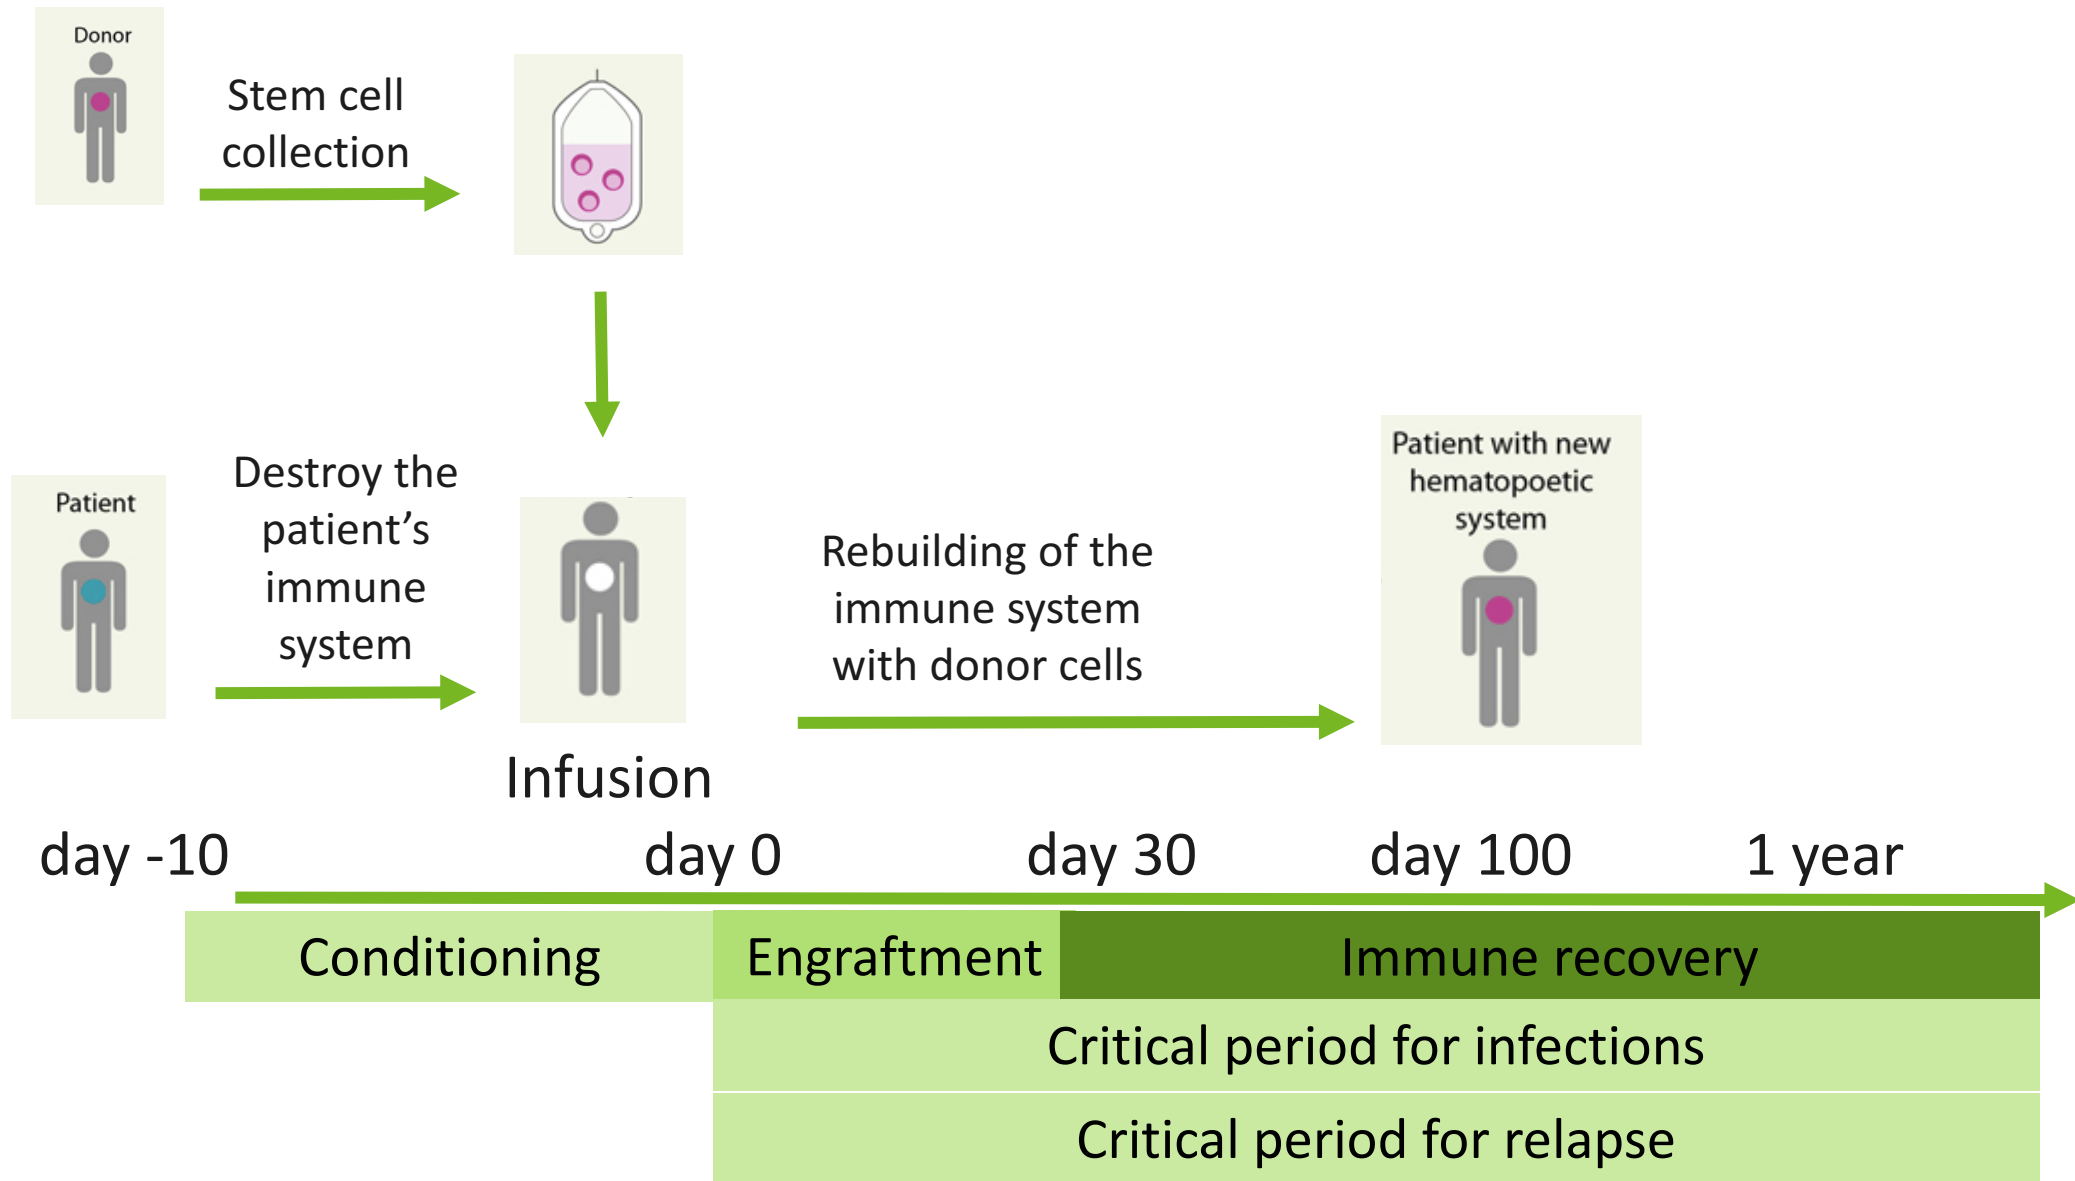

Indications:

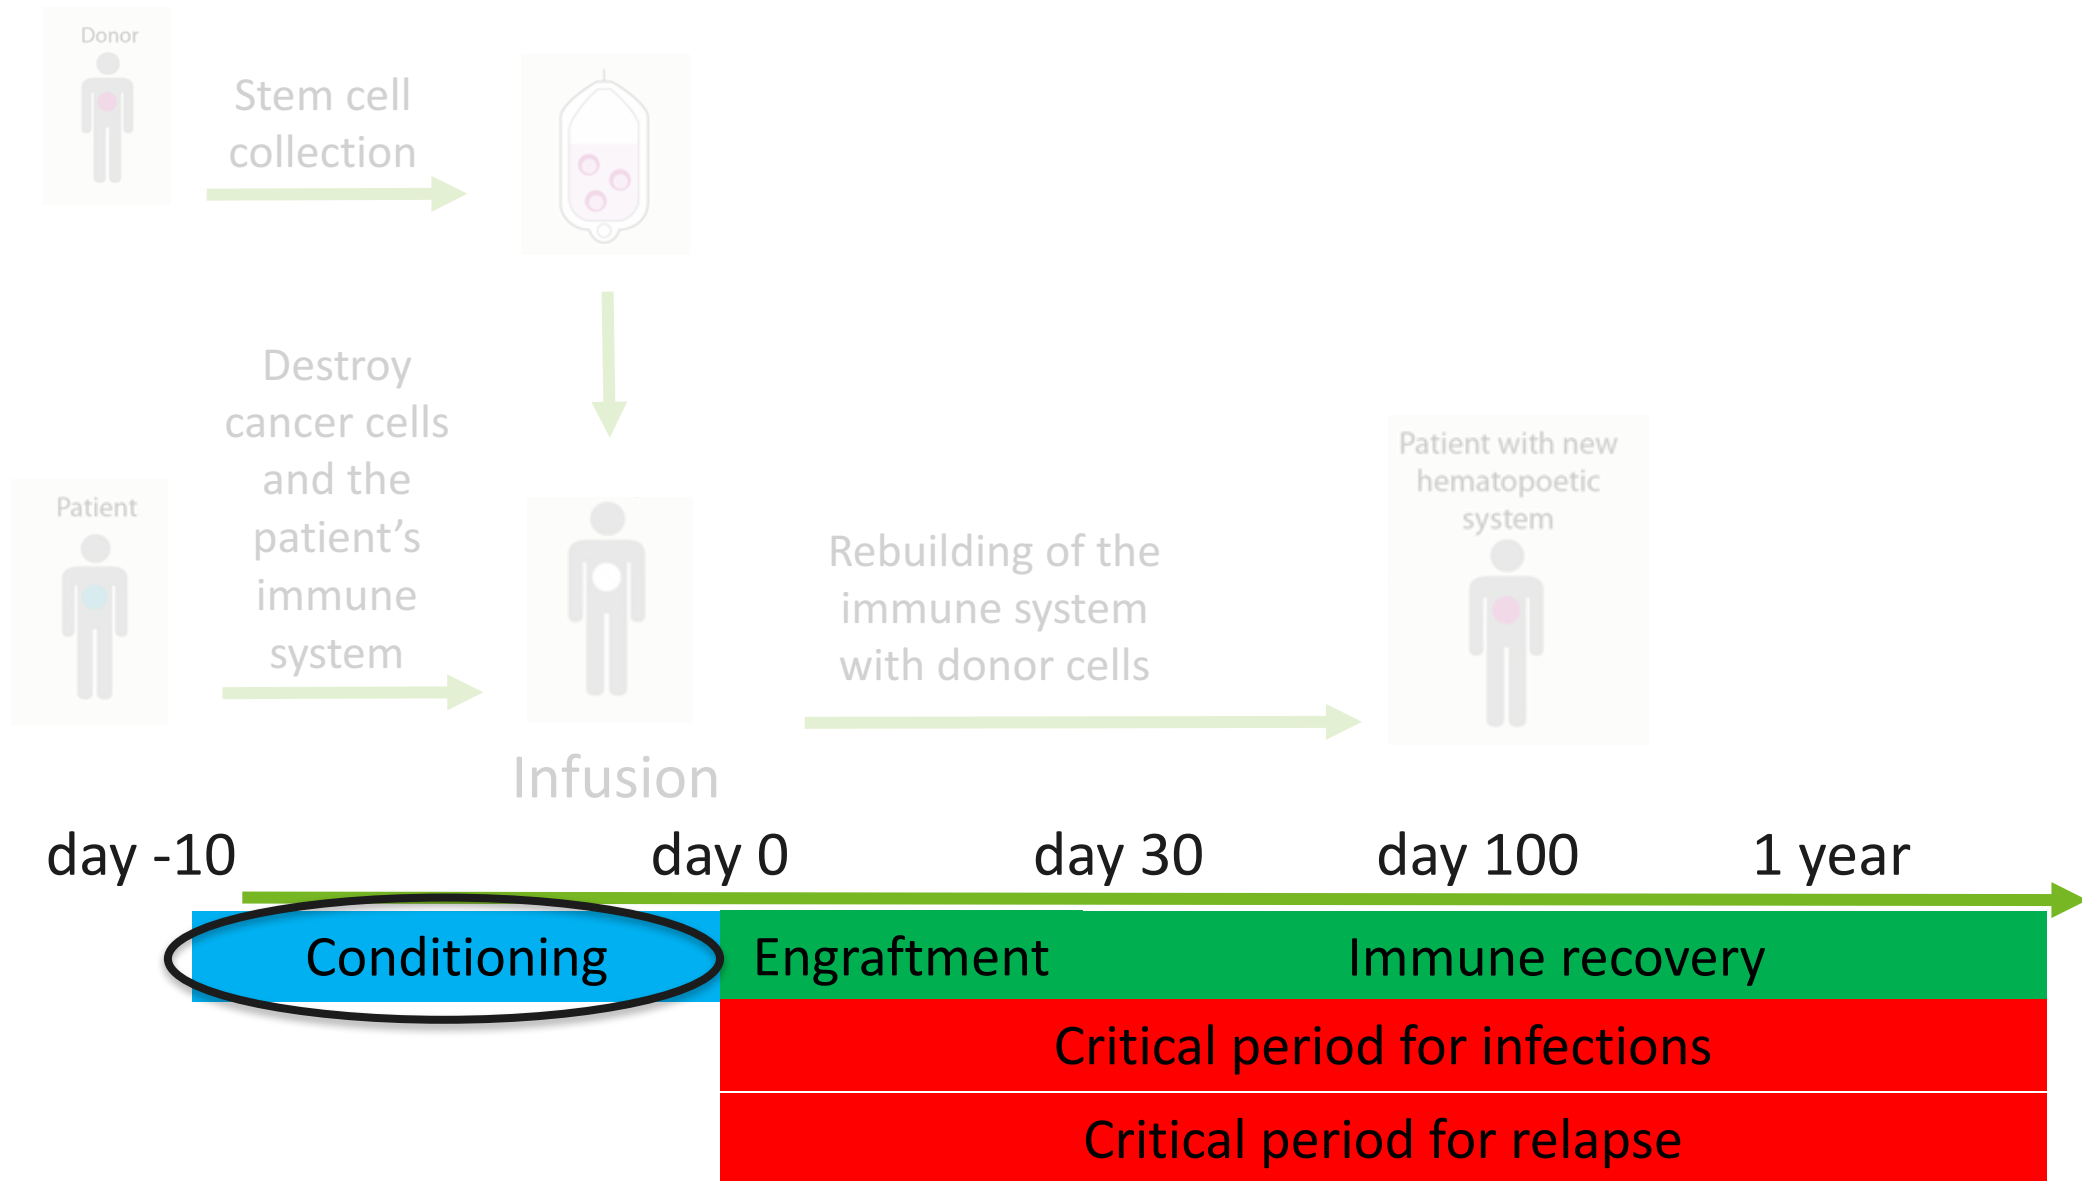

- Malignancies
- Immune deficiencies
- Metabolic/inborn errors
- Autoimmune disease
- Bonemarrow failure

Allogeneic hematopoietic cell transplantation (HCT)

Allogeneic hematopoietic cell transplantation (HCT)

ATG-FluBu as Standard Conditioning

Lympho-depletion

**Bone marrow
depletion**

HCT

**Anti Thymocyte Globulin
(ATG)**

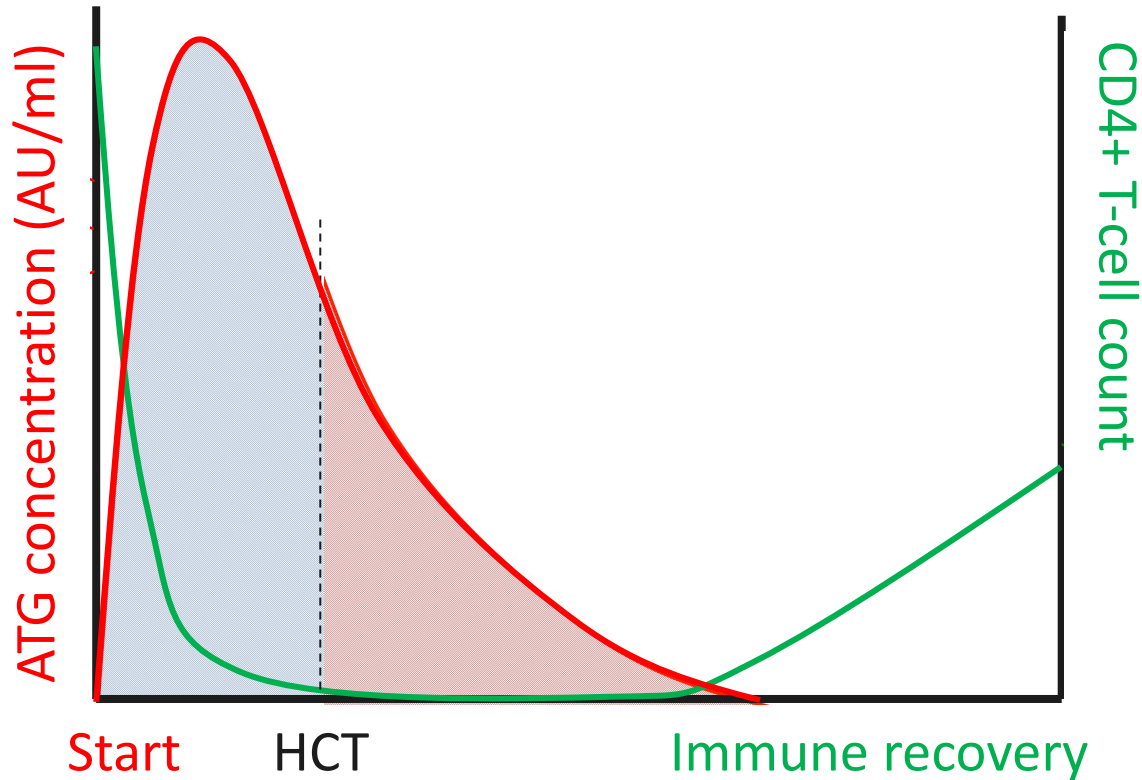

Busulfan (Bu)

Fludarabine (Flu)

Day: -9 -8 -7 -6 -5 -4 -3 -2 -1 0

Previous results: ATG & Busulfan (Peds + Adults)

Children & adults:

before and after HCT exposure of **ATG** relates to outcomes

- ✓ High ATG exposure before HCT reduces complications
- ✗ High ATG exposure after HCT hampers immune recovery

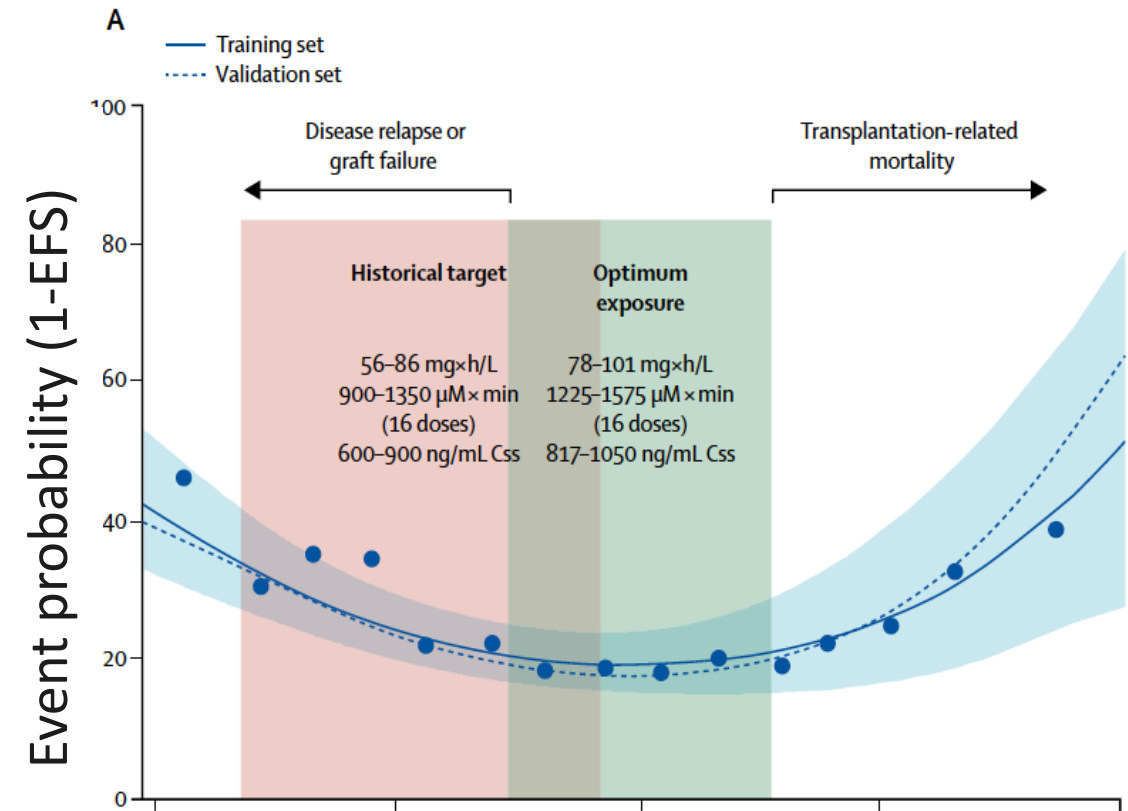

Previous results: ATG & Busulfan (Peds + Adults)

Children & adults:

before and after HCT exposure of **ATG** relates to outcomes

Admiraal et al:
Lancet Hematology 2015, 2017 resp.

Busulfan exposure (AUC: mg*h/L)

Children & young adults:

Busulfan cumulative exposure related to outcome

Bartelink et al: Lancet Hematology 2016

ATG-FluBu as Standard Conditioning

Lympho-depletion

✓ **ATG: targeted**

**Bone marrow
depletion**

✓ **Busulfan: targeted**

× **Fludarabine?**

HCT

Day: -9 -8 -7 -6 -5 -4 -3 -2 -1 0

Aim and Methods

Aim: Optimizing Flu exposures to enhance **immune recovery (IR)** and Event free survival (**EFS**):

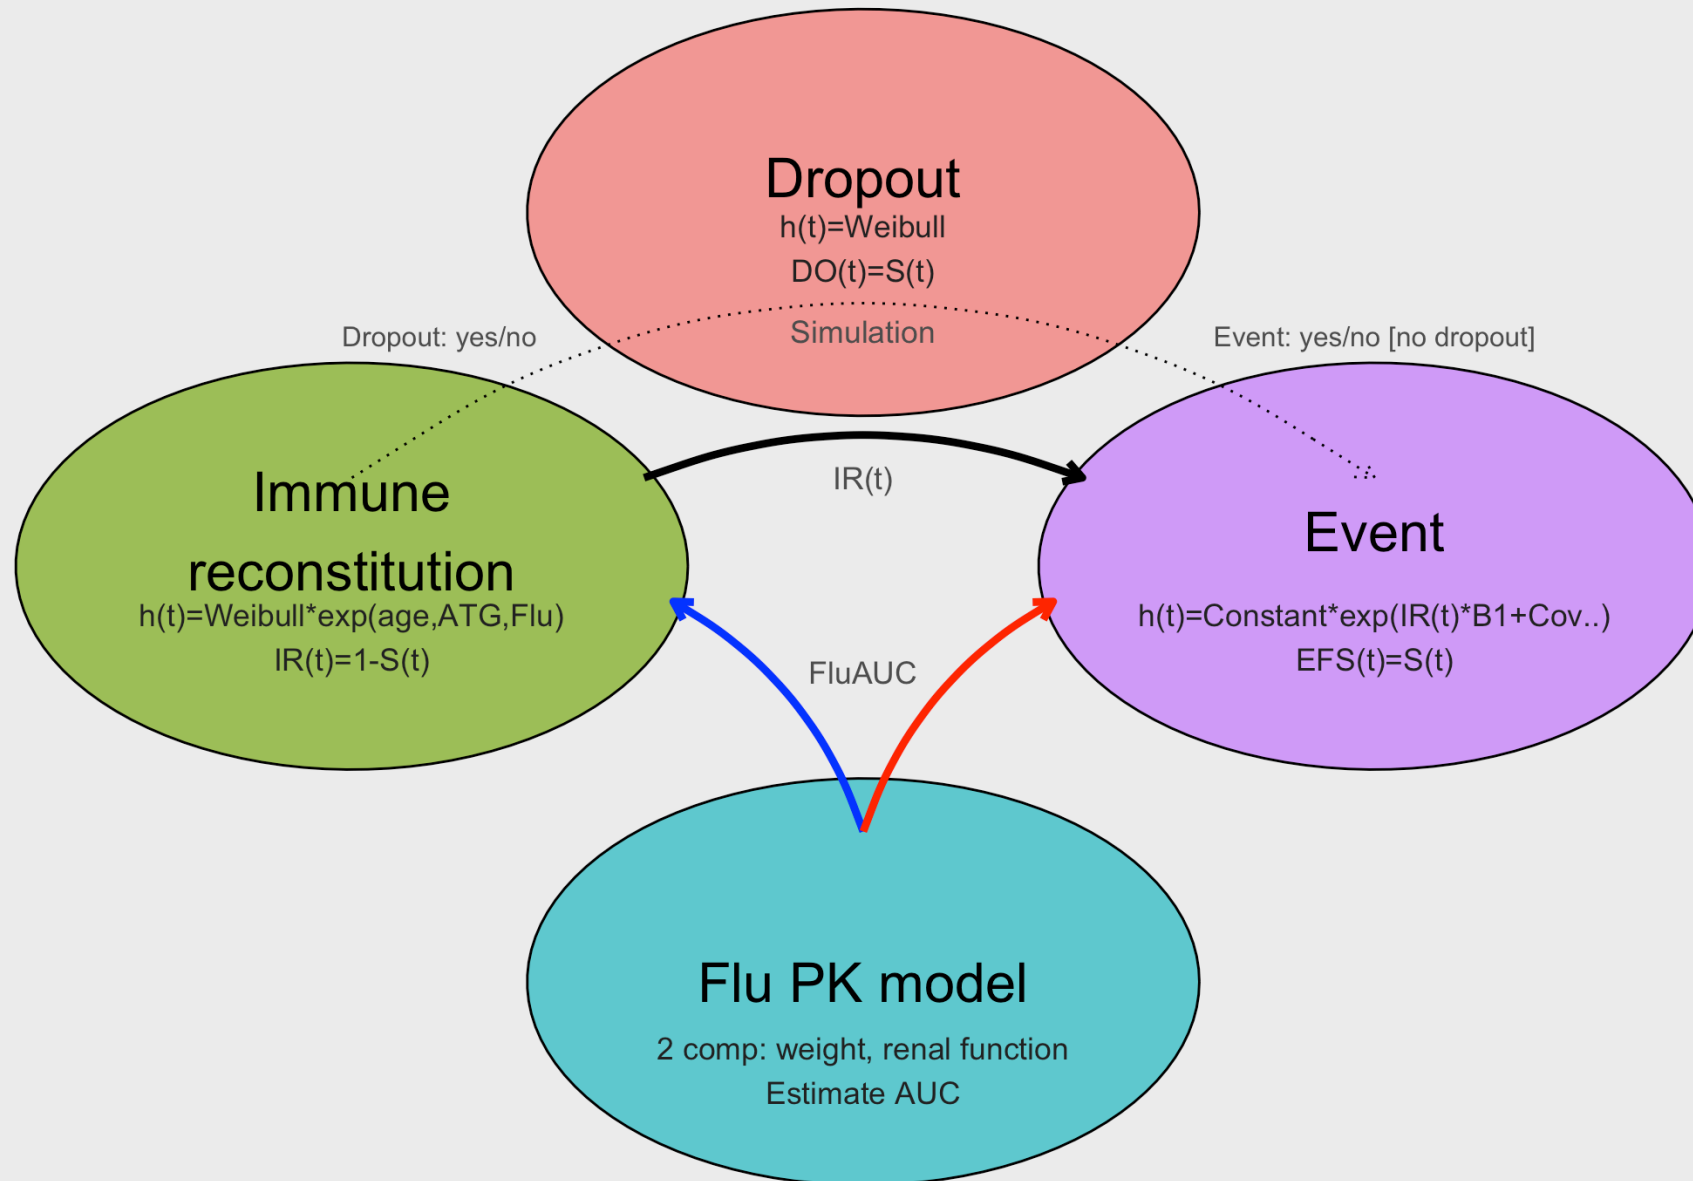

- **IR:** Two consecutive CD4+ T-cell counts >50
- **EFS:**
 1. Relapse
 2. Treatment related mortality (TRM)
 3. Graft failure

Methods

- Build Fludarabine PK model and calculate exposure
- Calculate effects of Flu exposure on IR and EFS: Kaplan-Meier estimation, Cox-PH models, Parametric TTE models
- Impute IR probability as covariate into EFS TTE model
- Simulating alternative dosing regimens to evaluate PK target attainment

Exposure outcome model

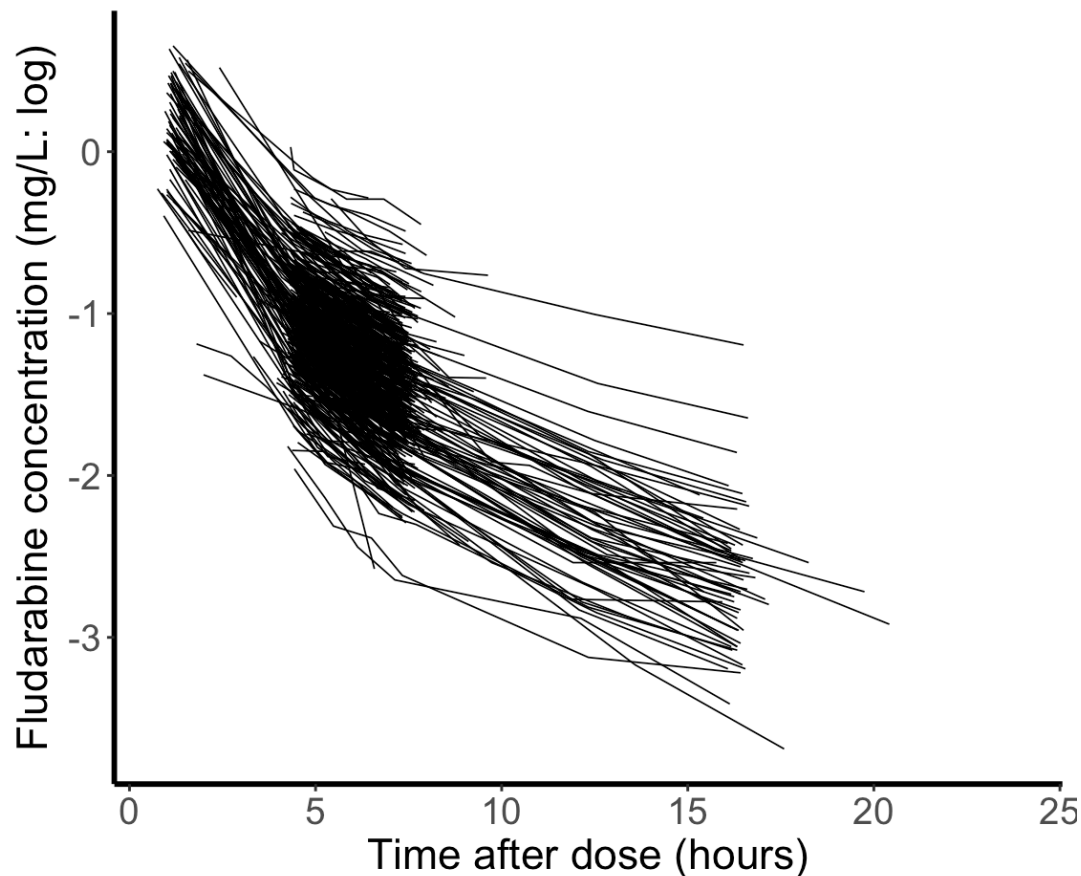

Patient cohort

Number of patients (IR available, PK model)	197 (181, 258)
Years of transplant	2010-2016
Adults (%)	65
Male sex (%)	60
Age in years (range)	37.7 (0.23 – 73.5)
Weight in kg (range)	65 (4.3 – 125)
Malignancies (%)	65
Median Busulfan exposure (IQR)	99 (92-107)
Cell source	
Cord Blood	65
Peripheral blood	116
Bone marrow	16

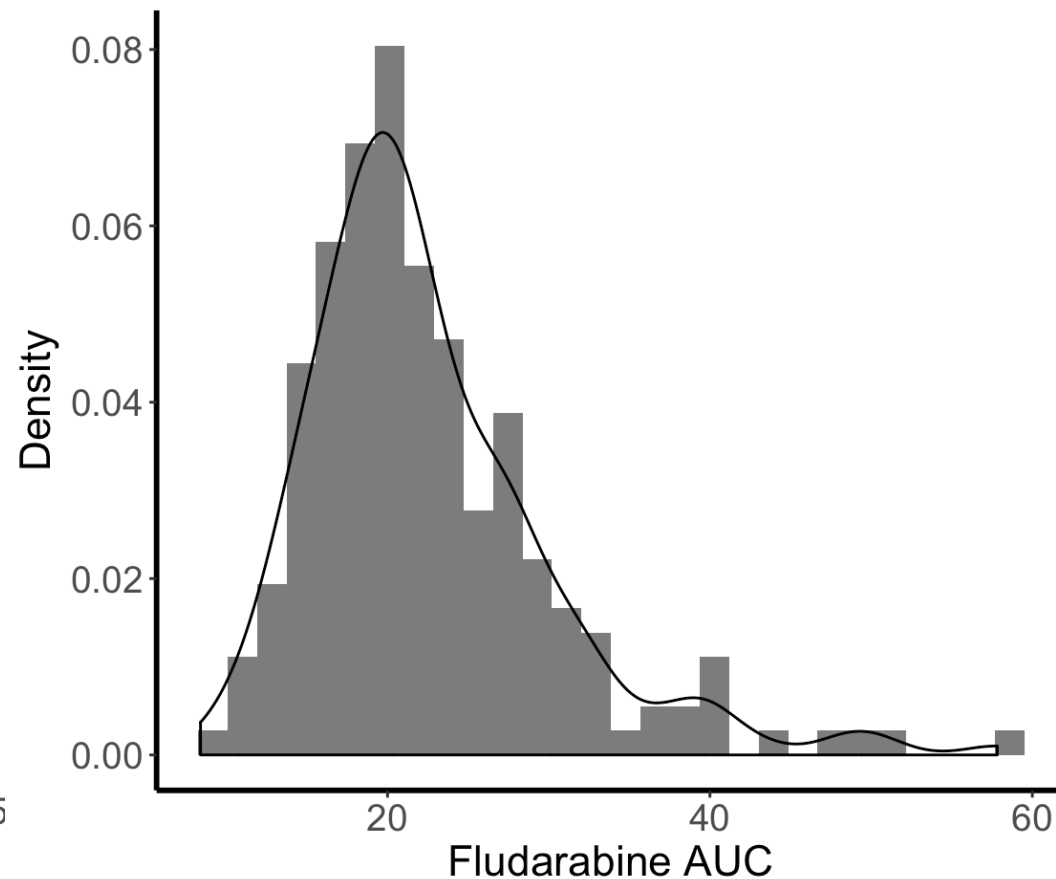

Flu-exposure variability

Log concentration ~ time after dose

Fludarabine exposure distribution

Fludarabine exposure range

Median (range) = 21 mg*h/l (9 – 57)

Dividing into groups according to exposure

Below Optimum Optimum Above optimum

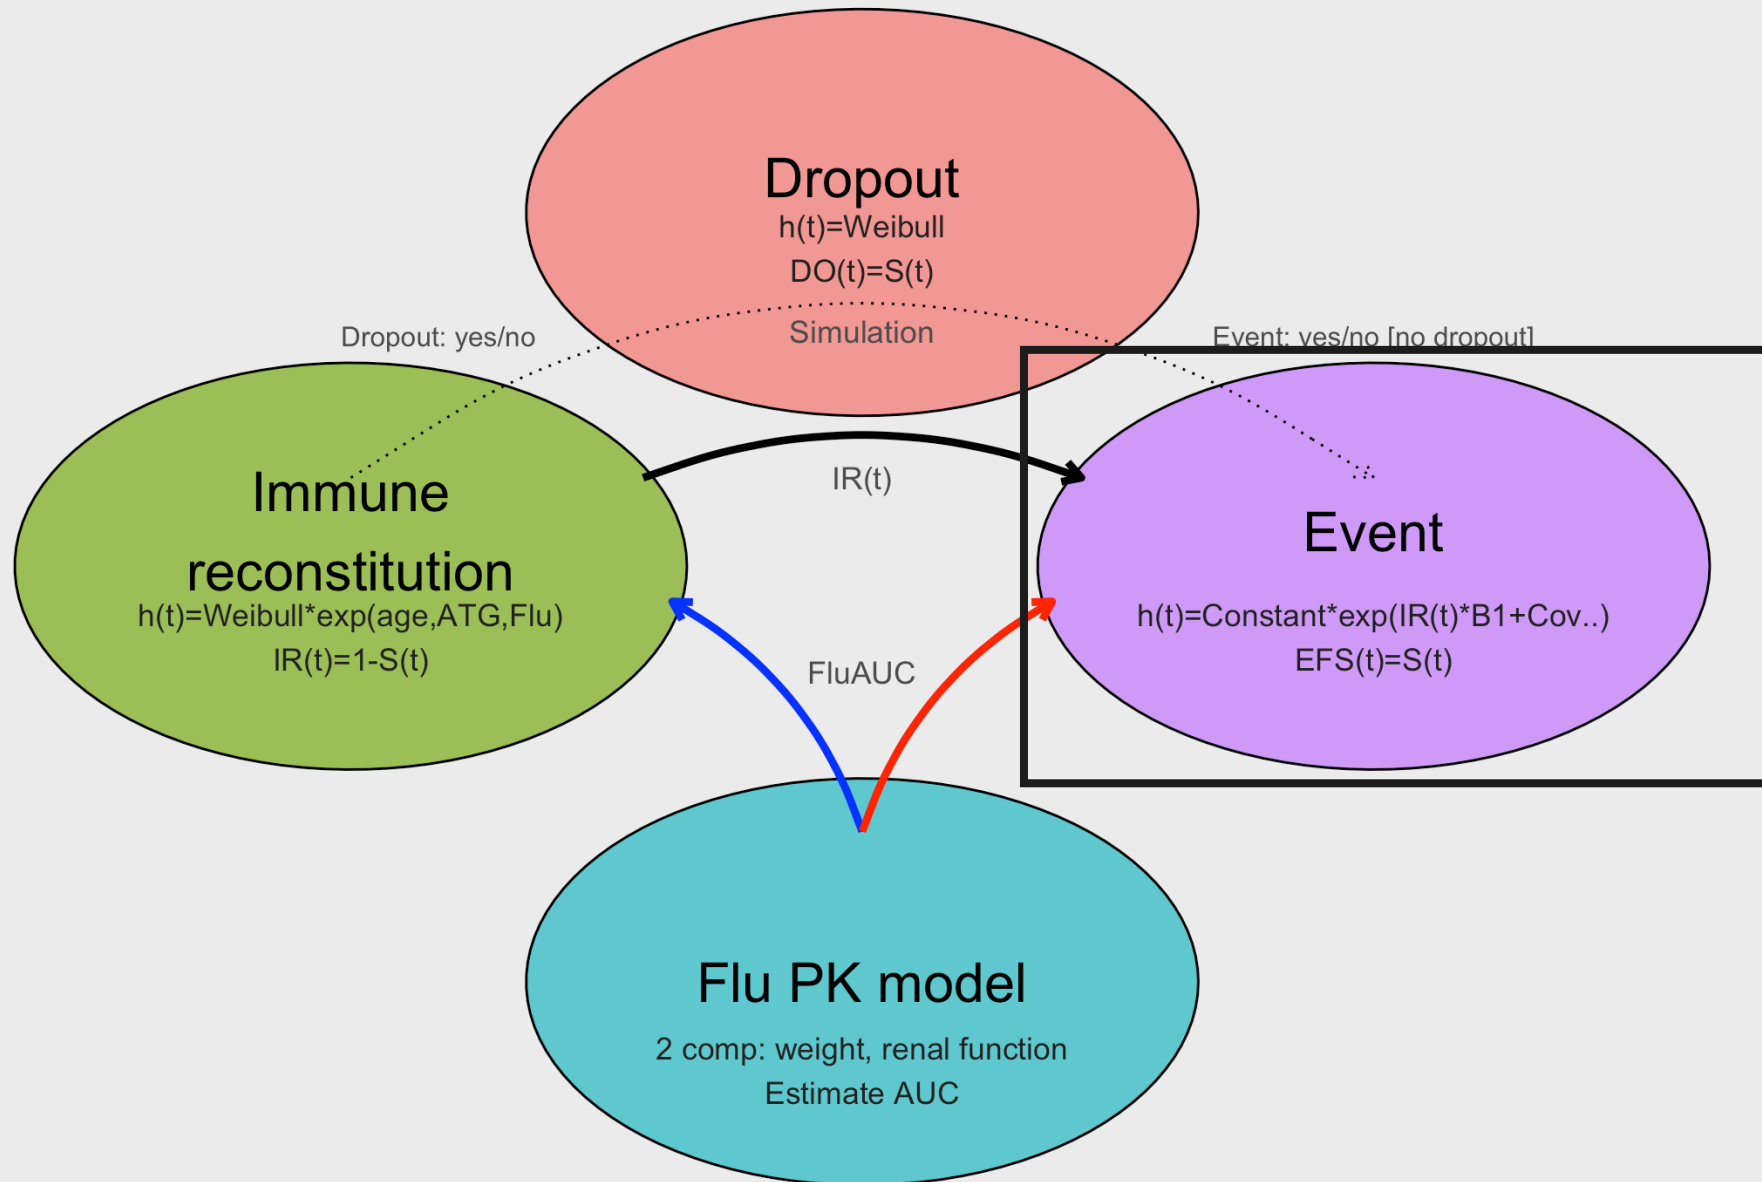

Outcome analysis: correcting for baseline risk

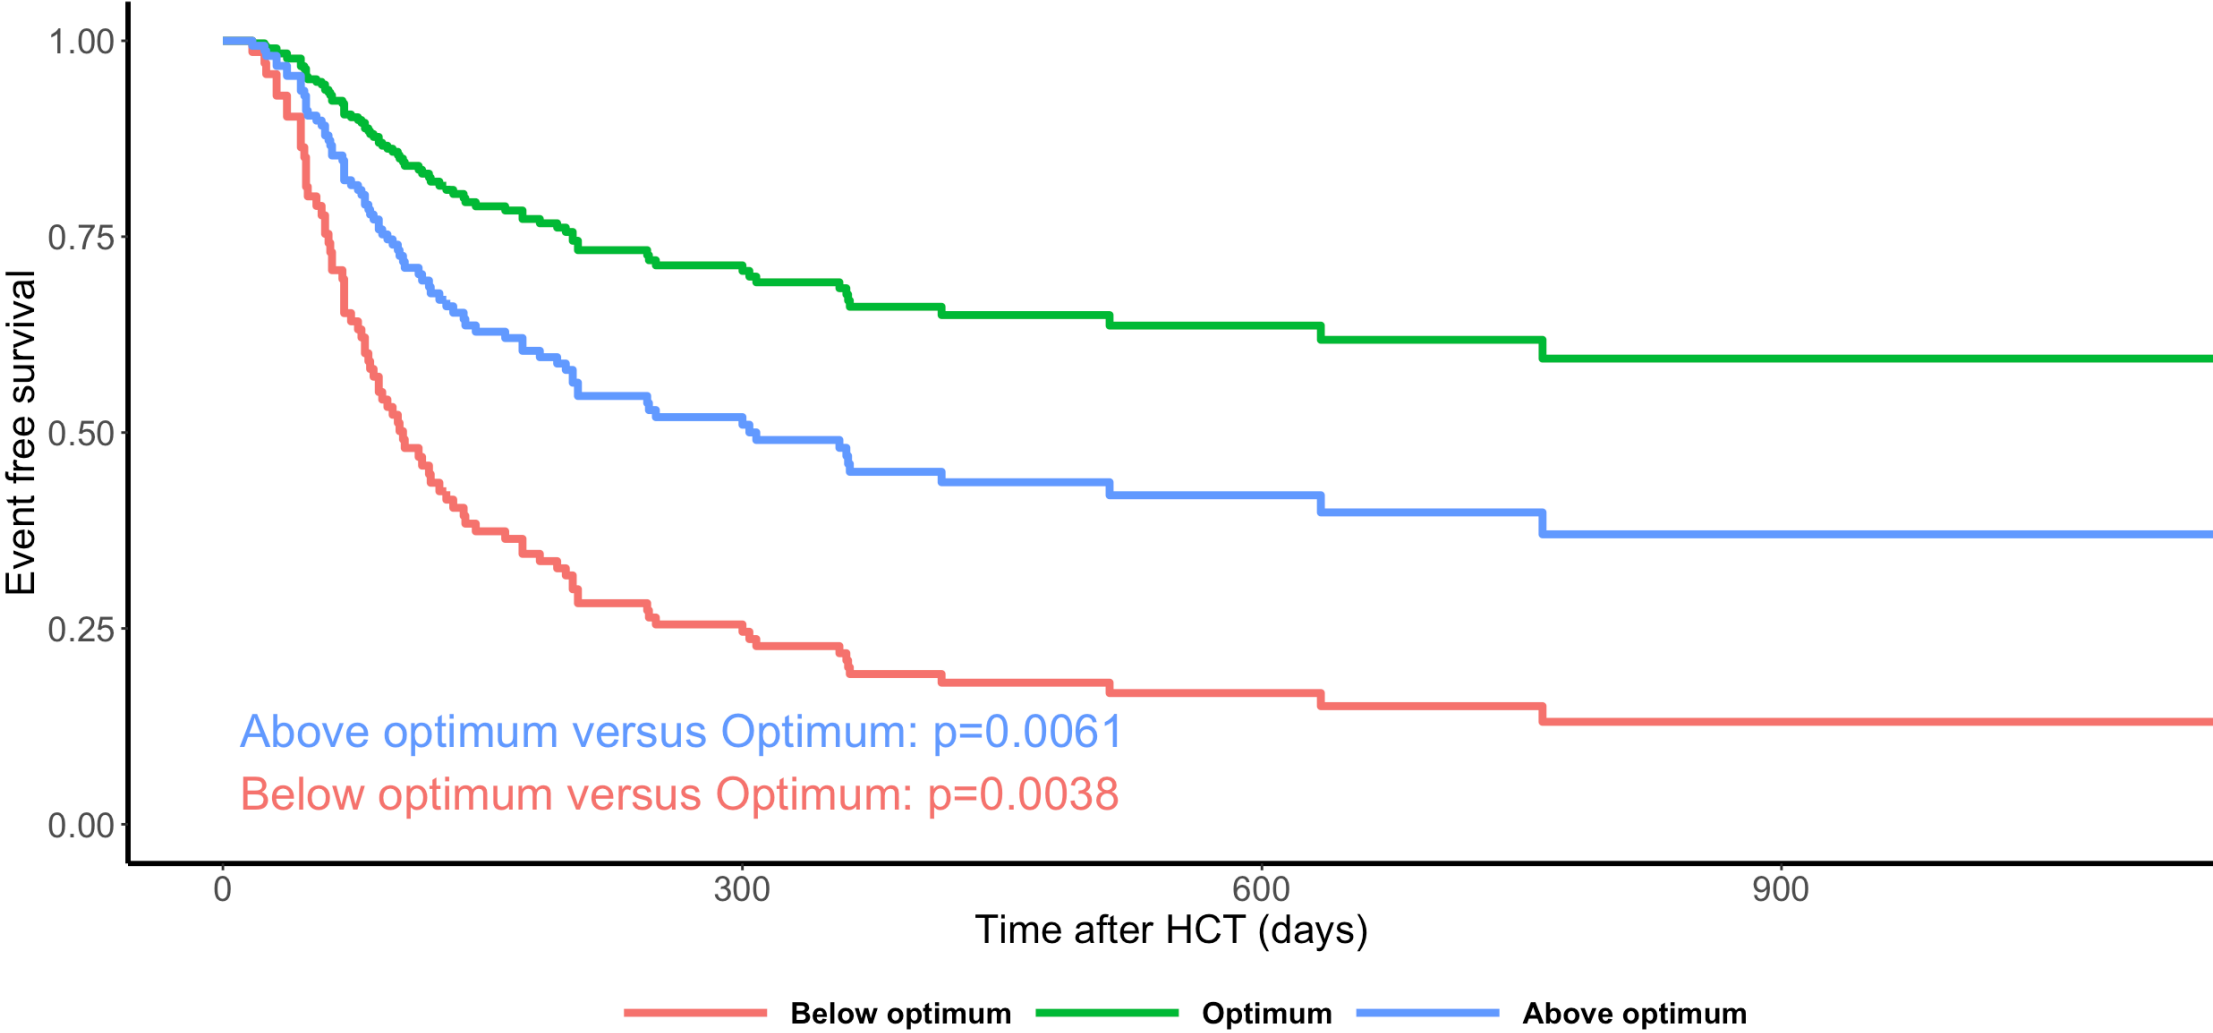

- **Event free survival**
 - Indication
 - Benign disorders: no relapse risk
 - Multiple Myeloma: high baseline risk
 - Myelodysplastic syndrome: high baseline risk
 - Leukemia/lymphoma: similar baseline risk
 - Older age was not associated with increased risk in this setting
- **Immune reconstitution**
 - Age: Children reconstitute faster than adults
 - ATG post transplantation exposure

Exposure outcome model I

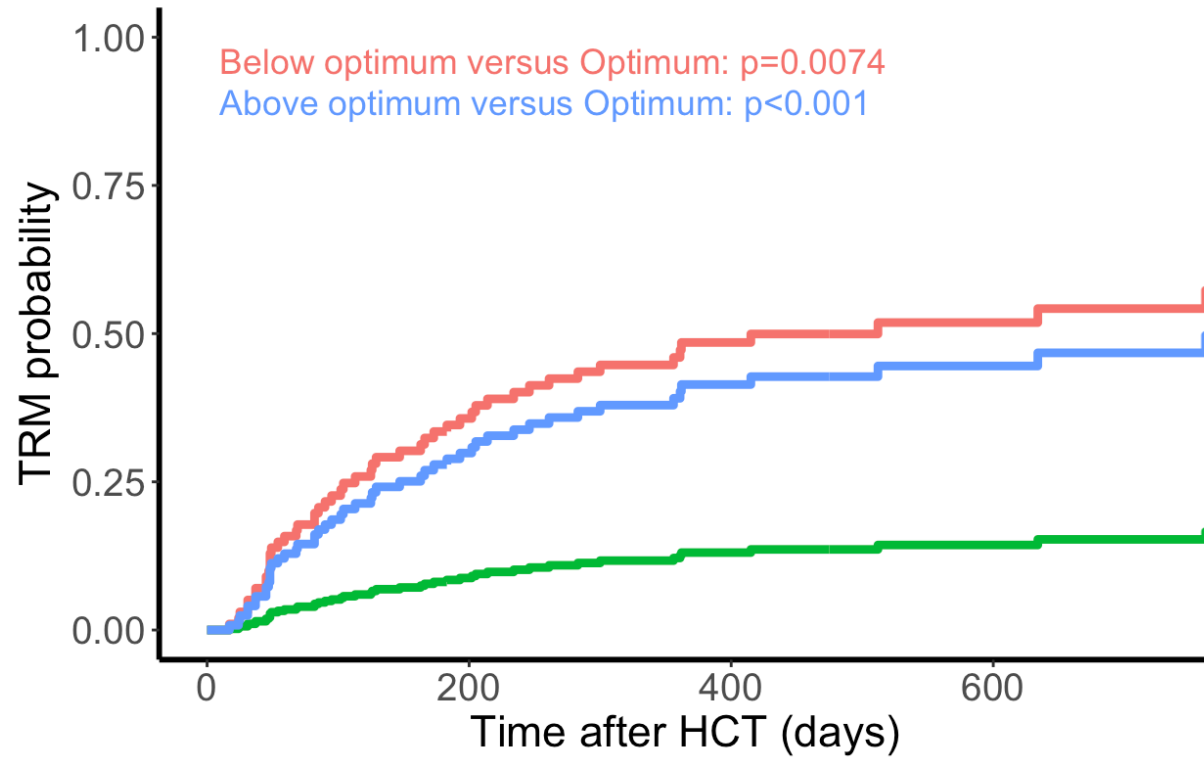

Events free survival according to cut-offs: adjusted

Events according to cut-offs: adjusted

Treatment related mortality

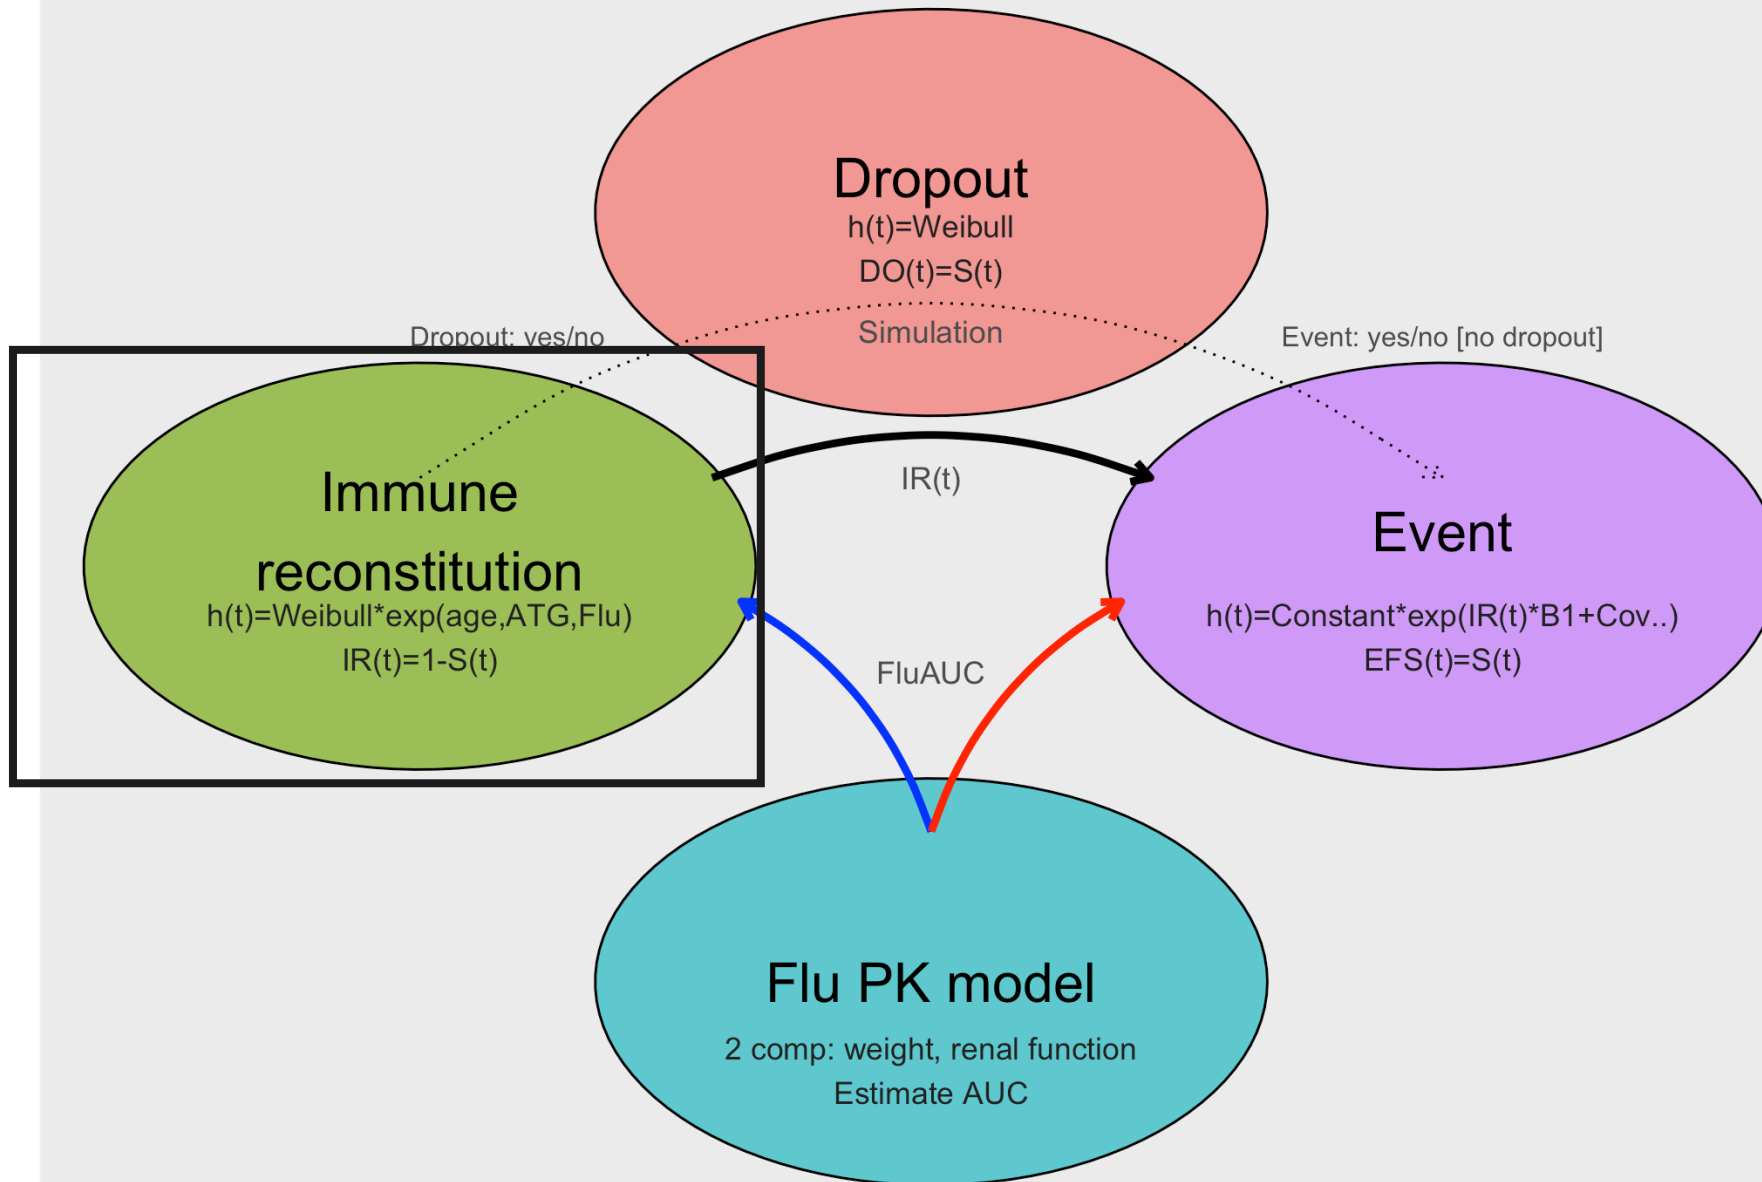

Relapse related mortality (RRM)

— Below optimum — Optimum — Above optimum

Exposure outcome model II

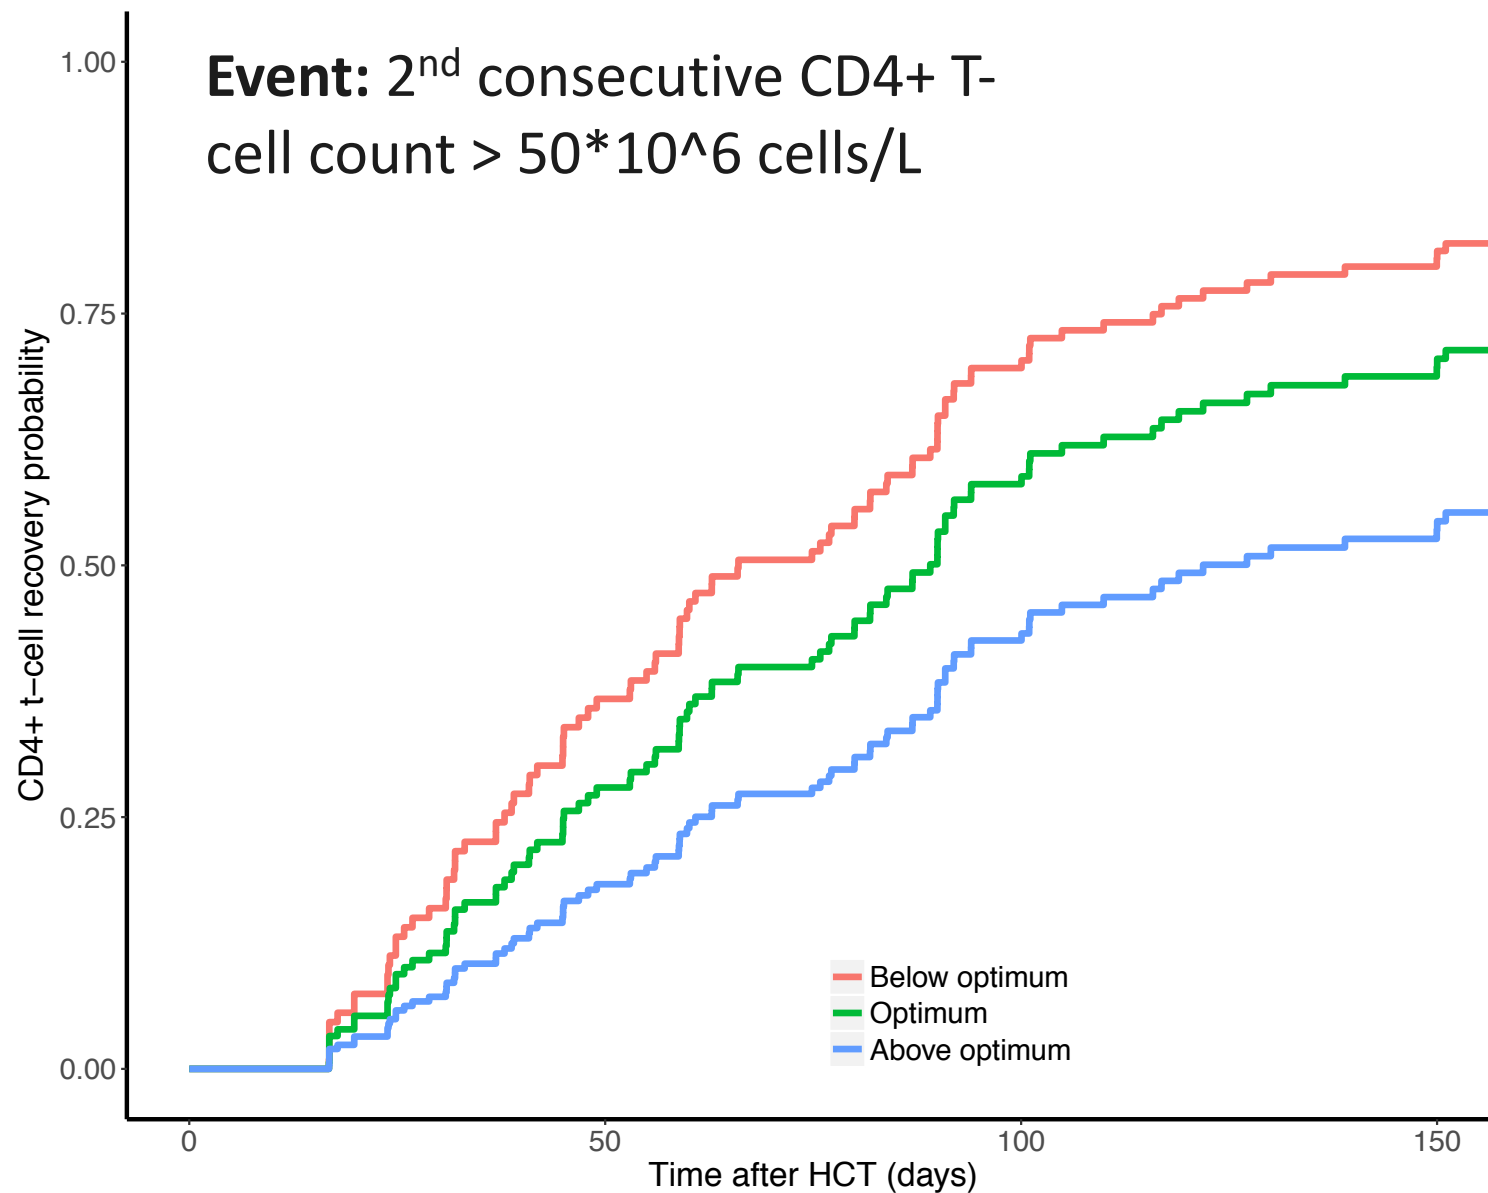

CD4 reconstitution: adjusted

Event: 2nd consecutive CD4+ T-cell count > 50*10⁶ cells/L

CD4 reconstitution: adjusted

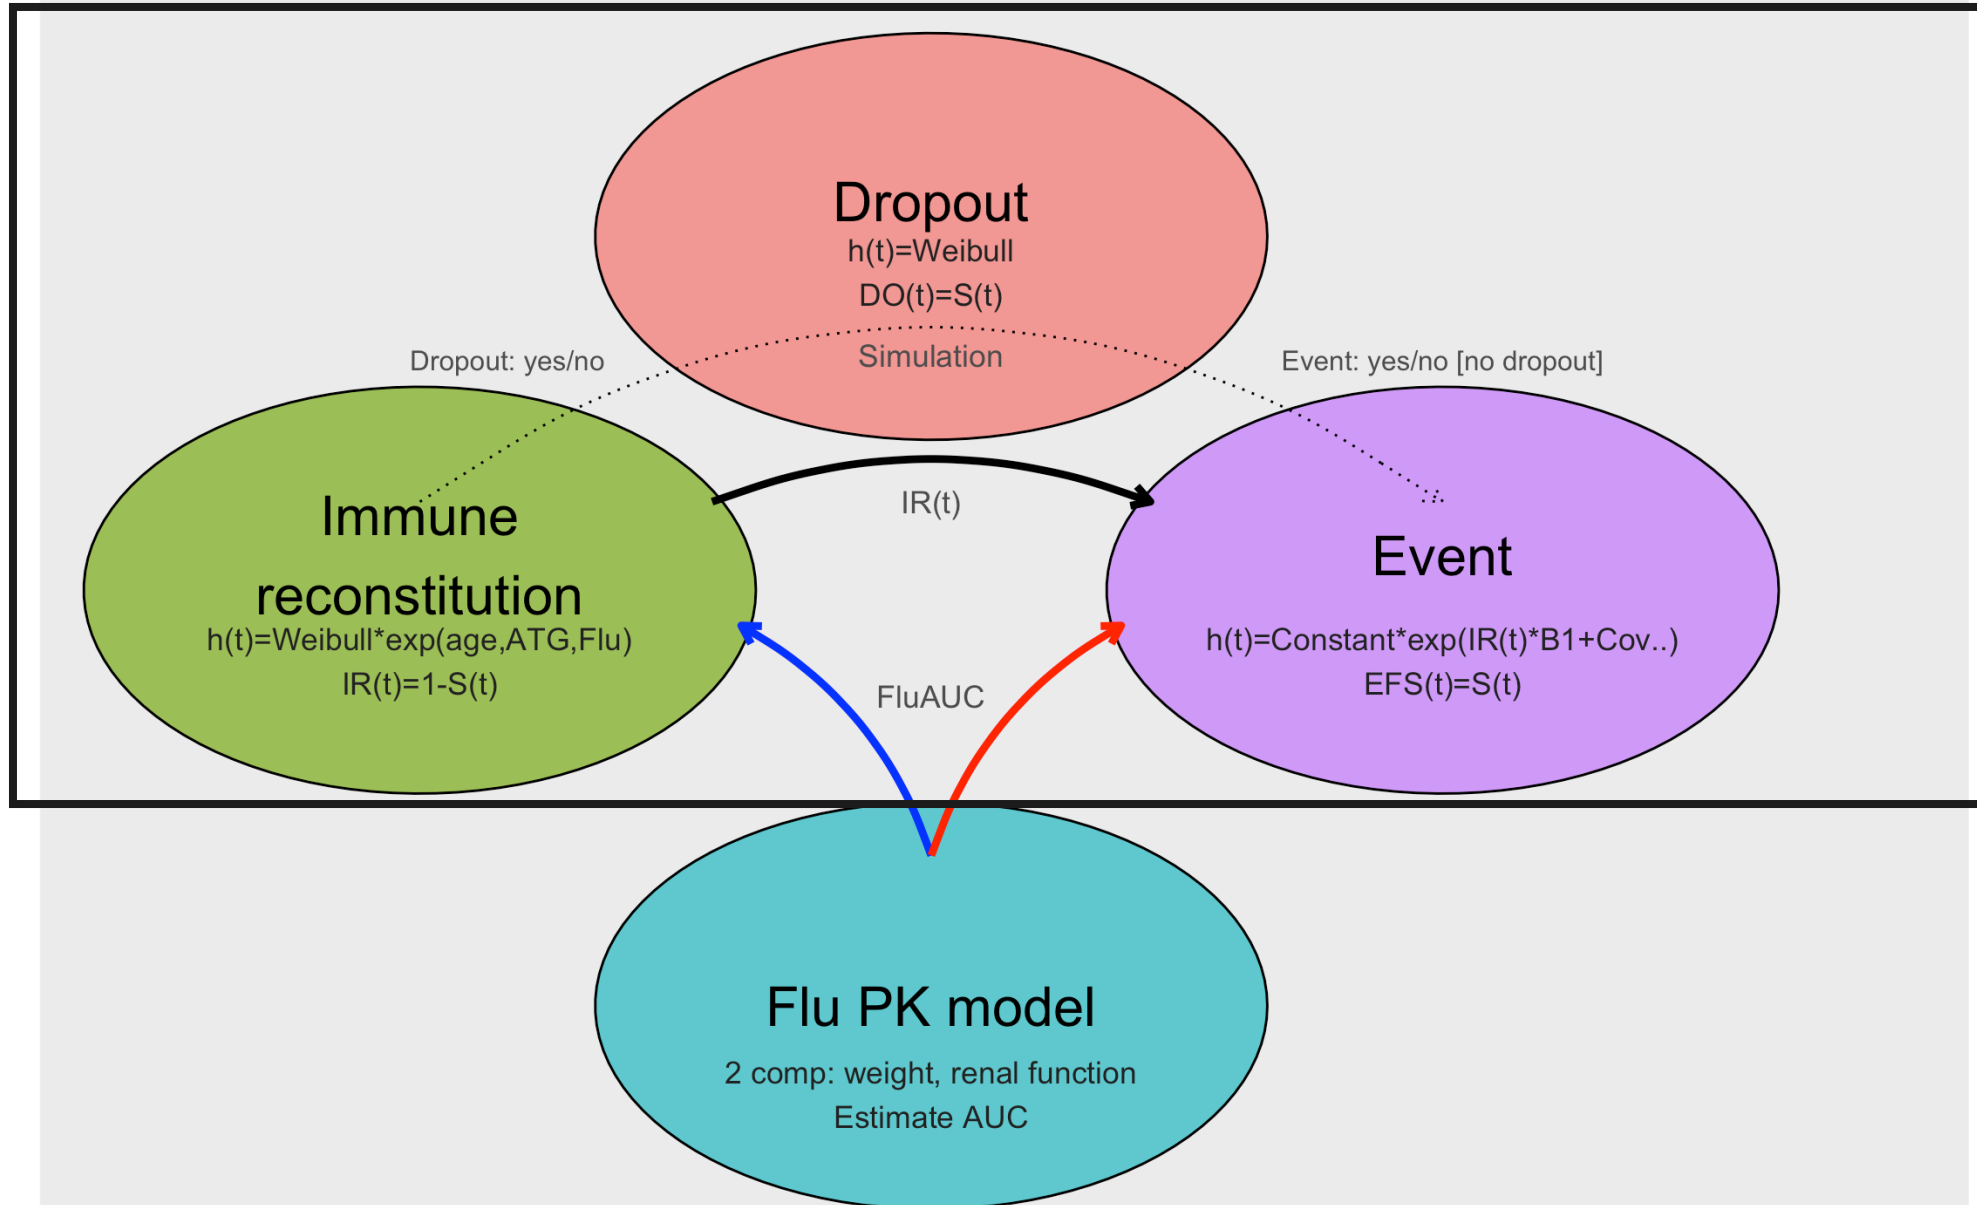

Event: 2nd consecutive CD4+ T-cell count > 50*10⁶ cells/L

Parameter	Hazard ratio	P-value (deletion)
Flu AUC (lin: 0-max)	0.11	<0.001
ATG postTx-AUC (lin: 0-max)	0.047	<0.001
Age ^θ	-0.19=θ	<0.001

Exposure outcome model III

Parameter estimates

Parameter	Estimate	RSE	P-value
Lambda _{tx-1year}	0.0456	30%	
Lambda _{1year-∞}	0.0049	70%	0.078
Immune Reconstitution probability (HR: 0-100%)	0.68	104%	<0.001
Optimum AUC (13-21 mg*h/l)	1		
Above optimum (>21 mg*h/l)	1.9	42%	0.0082
Below optimum (<13 mg*h/l)	2.9	56%	0.12
Leukemia / Lymphoma	1.00		
Benign	0.59	69%	0.051
MDS	1.4	98%	0.31
Multiple Myeloma	1.4	91%	0.34

Model Evaluation

Visual predictive check

Children: inside target

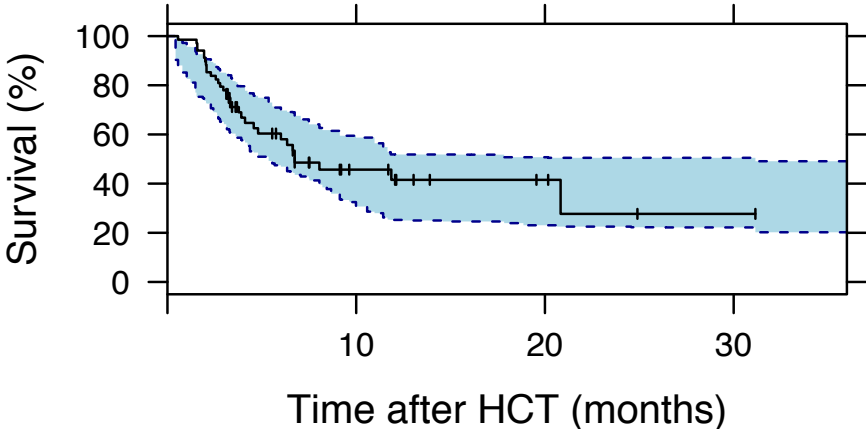

Children: outside target

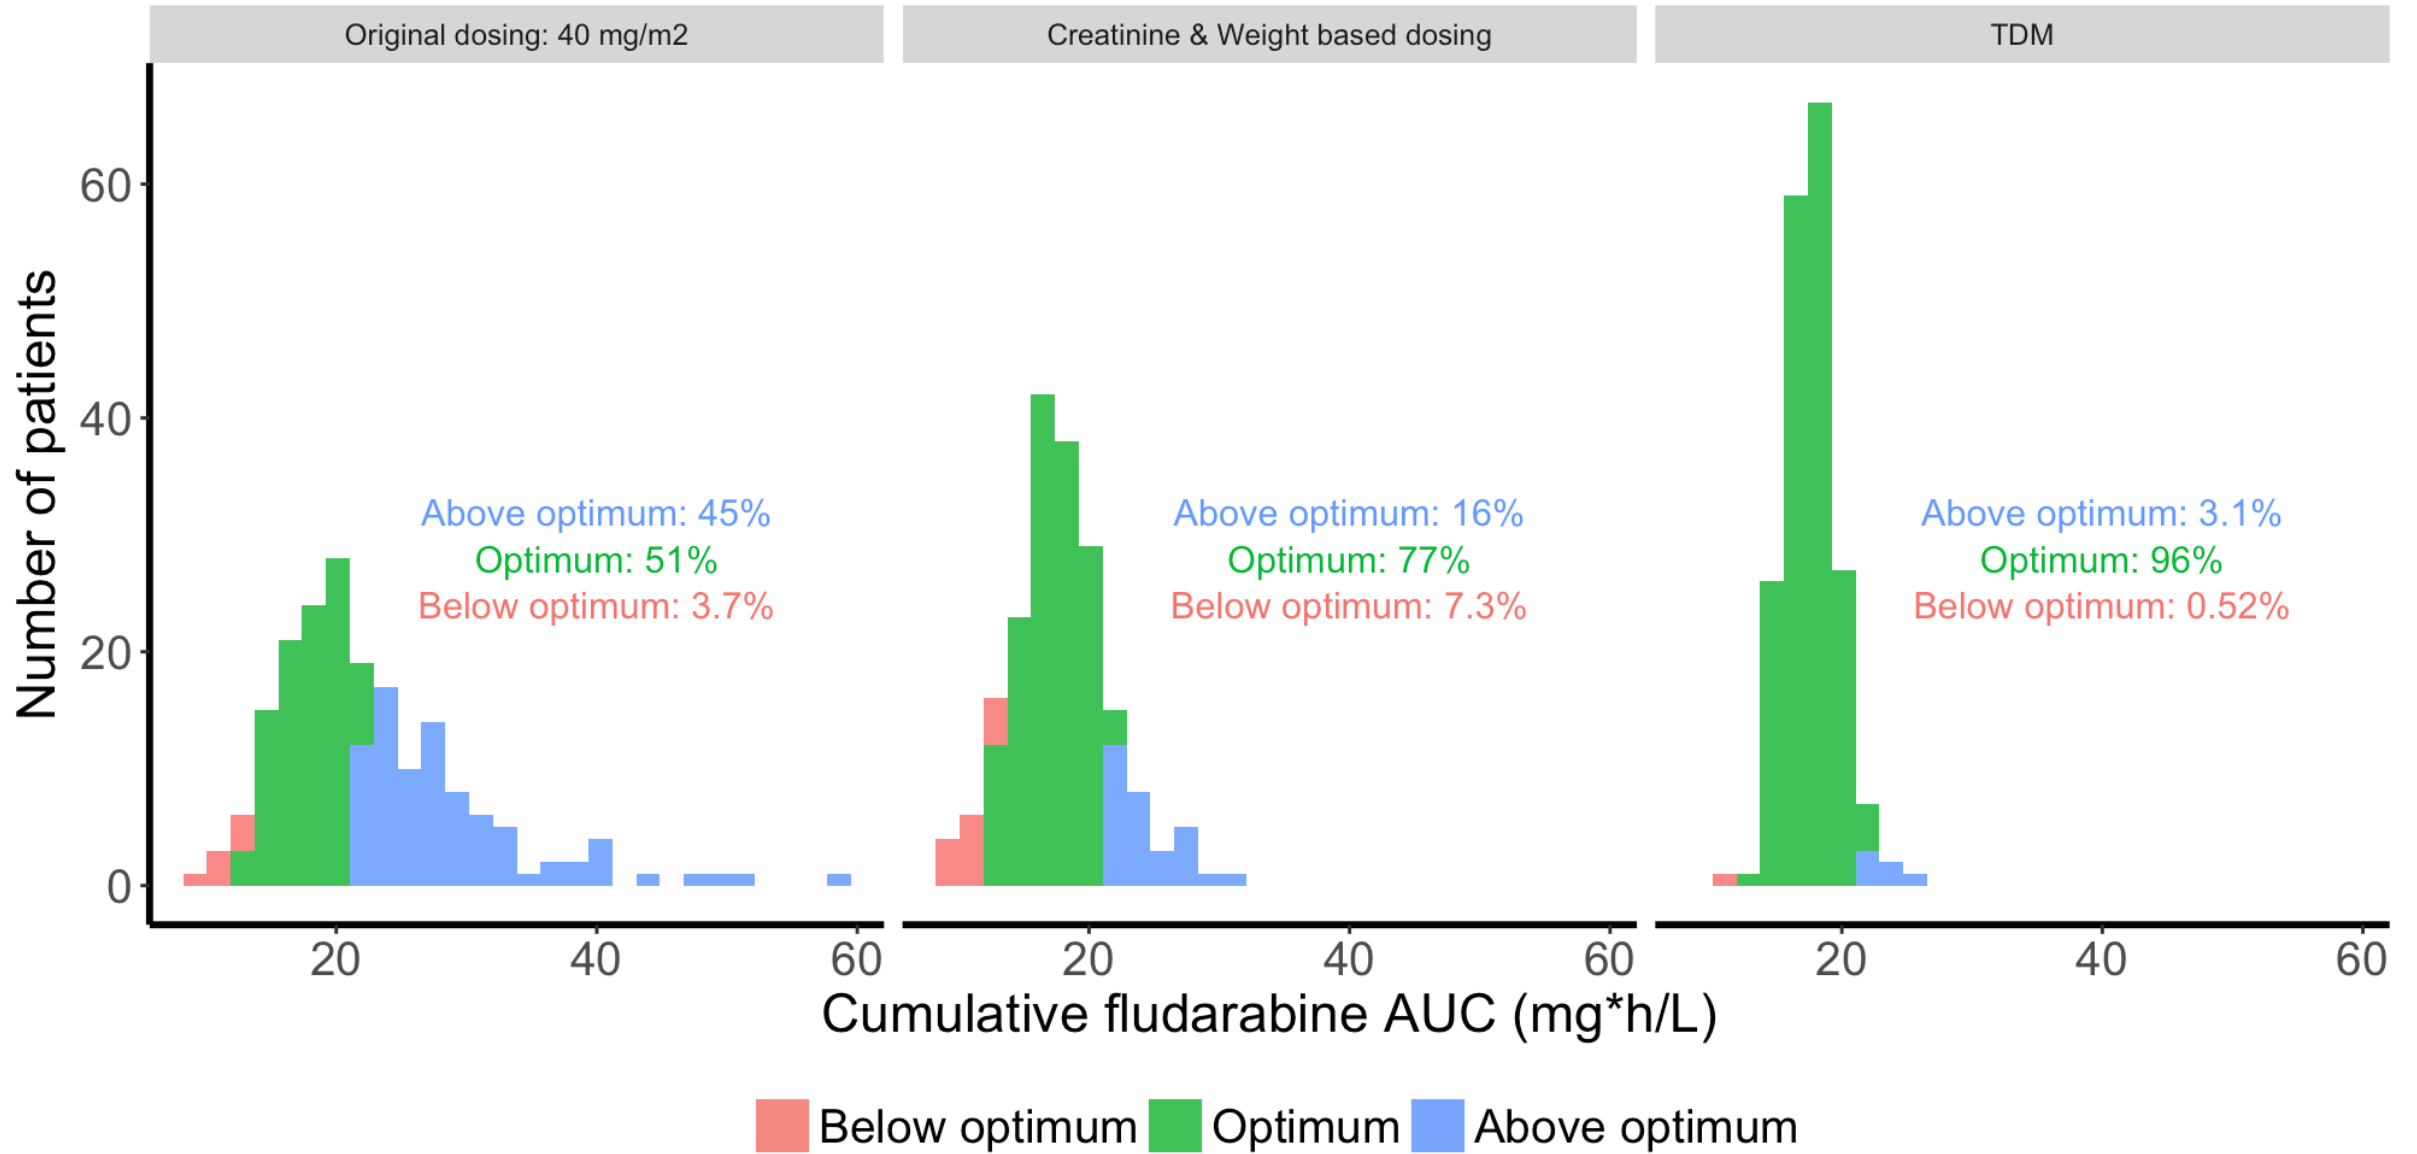

Adults: inside target

Adults: outside target

Alternative dosing regimen simulations

Summary

- We successfully derived a pharmacokinetic target for fludarabine at 17 mg*h/L (13-21) for all ages and indications
 - High fludarabine exposure is associated with higher mortality rate
 - Low fludarabine exposure is associated with failure of the treatment
 - Fludarabine exposure hampers immune recovery
- Faster immune recovery predicts for better survival
- Individualizing fludarabine exposure by better dosing and/or TDM could improve EFS after HCT
